

CALL FOR SESSIONS NOW OPEN

Landscape 2021

Diversification for Sustainable and Resilient Agriculture

20 - 22 September 2021
Berlin, Germany

Sessions, Masterclasses,
Market place booths,
Post-conference workshops

Call closes 31 October 2020

Rationale and Aims

Landscape 2021 will bring together scientists from across disciplines with key actors to explore whether and how diversity and diversification can contribute to more sustainable and resilient agriculture systems. Promising approaches reduce trade-offs between high productivity and use of external resources, the provisioning of ecosystem services, biodiversity and soil health, as well as contribute to robust economic perspectives, social justice, cultural values and recreational opportunities. We hypothesise that while diversification provides sustainable solutions at different scales, it is the landscape or *territoriales* scale where synergies and trade-offs between social and environmental objectives become tangible. Conference contributions will include research from natural and social sciences, inter- and transdisciplinary approaches on topics related to the diversification of crop and livestock production systems across scales.

We call for **sessions, masterclasses** and **presentations** of products about social science and natural science analysis on diversification in:

- Cropping and grassland systems
- Farming systems
- Landscape management systems
- Public and private governance systems
- Food systems
- Cross scale systems
